

SQData Announces Comprehensive Active/Active VSAM Data Replication Solution

Enterprise-Class VSAM Data Replication Framework Provides Continuous Availability of Critical Applications

Addison, Texas, Sept. 25, 2012 -- SQData Corporation, a leading provider of high-performance data replication software, announced today a comprehensive VSAM data replication solution designed for continuous-availability of critical applications. SQData's active/active VSAM replication feature allows file updates to be synchronized between multiple data centers across a large geographical distance. Data integrity is provided via built-in conflict detection/resolution and SQData's LiveCheck™ for VSAM, a feature that monitors data consistency during active replication.

“We were surprised to see that many companies are still using VSAM files for their mission-critical applications. Looking at the marketplace, we determined that there were few, if any, viable VSAM replication solutions available. By leveraging our high-performance data replication framework to include VSAM, we are able to provide customers with a reliable method of maintaining the continuous availability of their important applications.” said Scott Quillicy, CEO and Founder of SQData.

Highlights:

- Designed for extreme performance for installations with high transaction rates
- LiveCheck™ – monitors data consistency during high-speed replication
- LiveSync – resynchronizes data without having to take active files offline
- Supports VSAM Changed Data Capture (CDC) for both CICS and batch programs
- Support for Record Level Sharing (RLS)
- Native z/OS operation
- Built-in conflict detection and resolution capability
- Highly scalable and configurable

SQData active/active VSAM replication is available immediately. LiveCheck for VSAM availability is scheduled for 4Q 2012.
